Be safe together

Non-contact temperature measurement

Making our way from an 1,5 meter society to the new safety standards

Non-contact temperature measurement

Avoid cross-infection, no contact, thereby reducing the risk of the operator being infected by bacterial viruses. The disinfection process between patients for the thermometers is minimal or unnecessary.

To take a temperature, the person places his or hers wrist 1cm -4cm to the temperature measurement module on the right side. The screen displays the body temperature.

Privacy proof

Only measures wrist temperature, not capturing any data.

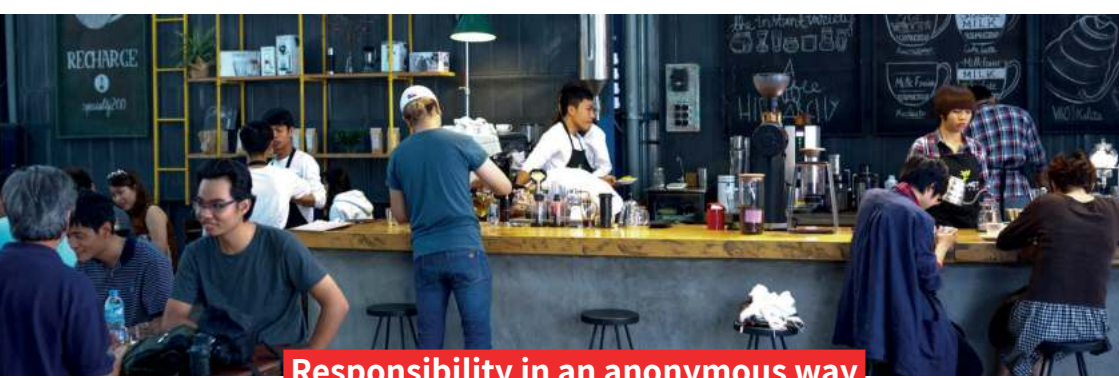

Real-time temperature detection and screen display

High temperature voice alarm and visual warning.

- Temperature range: 30°C-45°C
- Temperature accuracy: 0.1°C
- Temperature deviation: 0.3°C

Built-in infrared thermoelectric sensor

**Responsibility in an anonymous way
to your staff and customers**

Efficient and accurate

With this simple 'one person' operation, non-contact measurement, there is no need to wait and no need for (trained) operators.

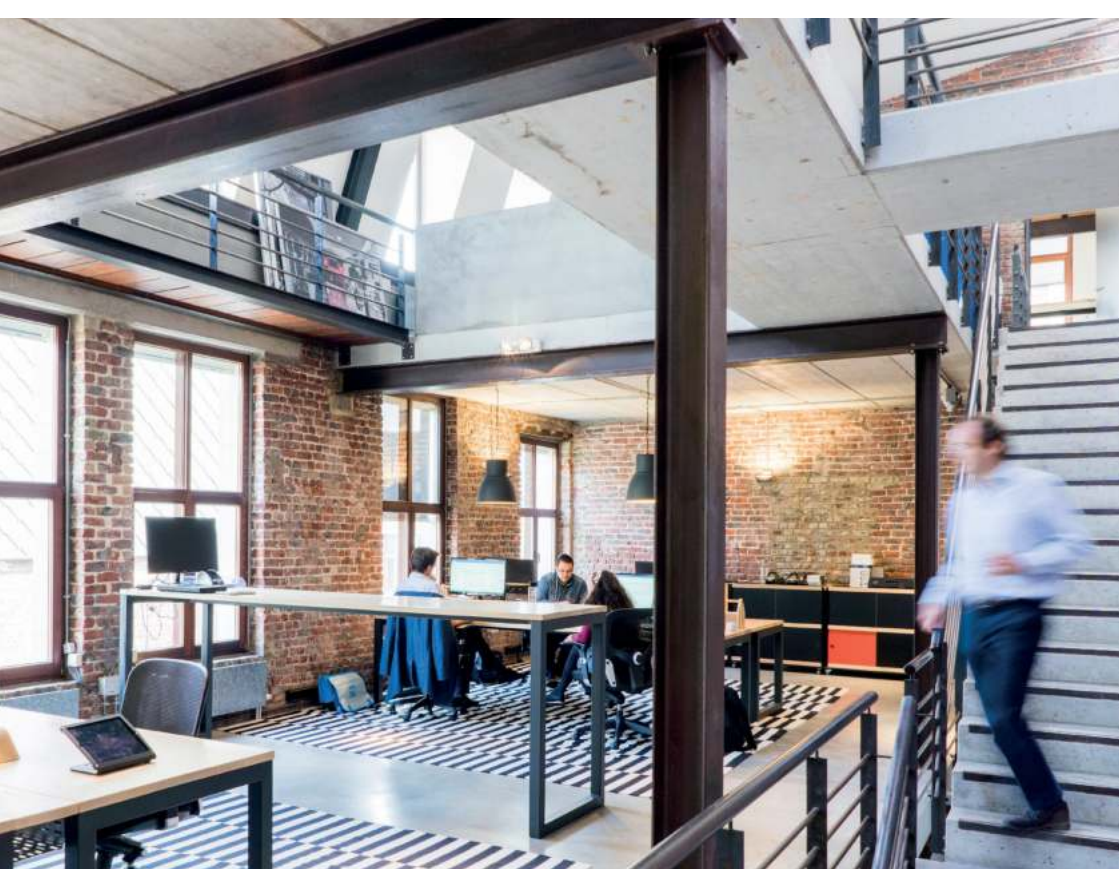

Stylish and easy to integrate at your location

20-30 people per minute

can be measured, allowing for easier and faster use when screening large numbers of people in settings like airports, restaurants, shops, schools and offices.
